

K2 BUSINESS

For Whom It Is Intended

The K2 Business product is intended for firms which expect easy and quick putting the information system into operation; however, they require high-quality and professional standard thereof. The main advantage thereof is its complexity, insertion of the data into the system by the user only

once and subsequent usage of such data as the firm's information base. Business transactions passing through the company are recorded systematically and their economic benefit is evaluated continuously. By utilization of this system, the firms obtain administrative simplification, stable and faultless records, extensive and sophisticated application, and transparency of internal processes.

Aim

The aim is quick, smooth implementation of the product which enables for the user to start using it by him/herself on the base of clear and standard methodical procedures and proved know-how. To get time and energy for the own line of business by integration of the information infrastructure into a comprehensive solution.

Benefits

- > professional information system with proved and tested structure as concerns processing of the business transactions
- > high degree of elaboration and coherence of particular areas
- > better resistance to unqualified interventions
- > awareness of the fact that specific service functions

are included in the system and in case of need it is possible to use them effectively through qualified intervention of a consultant

- > simple model of licensing with absolute number of parallel users irrespective of their activities

Advantages

It is possible to adapt and, within framework of a firm, to modify or create own printouts.

By means of skilled consultant's intervention, it is possible to activate inaccessible usage of application script language and to create any forms and functions, including complex printouts. As a result thereof, there is unlimited number of branches for which it is possible to modify standard method for processing a contract in the K2 Business.

The user is able to use the product immediately after short installation. For this purpose, standard procedures have been prepared and preset including demo data which can be used.

Common Feature

Protection of the investment consists in transferability of experience, training of the users as well as operating procedures between particular products in the K2 Software line. The user interface and control logic of the K2 Business product is identical to the K2 Professional and K2 Enterprise products.

By utilization of this system, the firms obtain administrative simplification, stable and faultless records, extensive and sophisticated application, and transparency of internal processes.

The product enables simple functional actions such as reception of a demand, of an order, reservation of articles, their preparation, release, invoicing, payment, booking, and evaluation.

The K2 Business product enables to carry out the installation by own effort.

In the licence price, a database is included automatically.

Description

The K2 Business product keeps the extent of the solved areas the same as in the K2 Professional version. A difference between functionalities of these two products consists in particular in the degree of processing of the individual areas. The product enables simple functional actions such as reception of a demand, of an order, reservation of articles, their preparation, release, invoicing, payment, booking, and evaluation. At the same time, the K2 Business product is intended for monitoring and managing simple production or assembly.

Trade

The principle concerning management of business transactions makes use of high-tech system as regards interconnection of primary documents items. Thereby, well-arranged and simple recording of demands, orders, reservations, delivery notes, release notes, invoices for goods, products and services is provided. Selective and continuous switching between particular documents while keeping the monitored item contributes to the comfort of the control. The coverage of item function displays a profile across states and documents in which it is to be found. As a matter of fact, variability with regard to the definition of cards of contractors/customers, articles, prices, alternate units of measure, stocks etc. is ensured.

Production

It is focused mainly on creation of the technological procedure consisting of items from defined categories. By planning of the existing procedure, it provides the operators with a picture about possible deadlines and material coverage. The application leaves to the user the logic concerning sequence of the job orders, division thereof into batches and capacity assignment. By gradual rendering of production job cards, continuous information is obtained about the size of the production in progress and about any differences between the plan and the reality. Thereby, the user gets information about the extent to which the calculation was accurate.

Accounting

The benefit as concerns utilization of the K2 Business product in the economic area lies in particular in the extent of possible presetting of the accounting acts. Thereby, the role of the user is significantly changed, namely from a routine accountant to a person deciding about booking of extraordinary cases. Therefore, the accounting department, within the K2 Business product, can pay attention to the checks instead of creating records in the accounting journal.

The licence includes following modules: Assets, Personnel Data and Wages and Economic Analyses as necessary to comply with the legal obligations imposed on the operators.

Installation

The K2 Business product enables to carry out the installation by own effort. There are defined areas which is necessary to carry out within framework of the installation and it is left to the client which of them s/he performs by means of own resources and which of them will be ordered as an expert service. By analogy, there are services for particular modules which must be performed before starting their proper usage. The client can make use of training or documentation which is an equivalent to the training. Thus, the client decides fully on financial intensity in relation to the installation.

Extensibility

By ordering expert services, it is possible to adapt the extent of the used application according to the individual requirements. Should the firm feel that it is necessary to assume the specific service functions being off at the present time and to develop further the information system by the own effort, it can switch any time to a higher licence in the form of the K2 Professional or K2 Enterprise products. The reason for such a changeover can be understanding and acquisition of the internal programme principles as well as ambition to use the system not only as a tool for data recording, but also as a manner how to obtain a competitive advantage.

Technology

In the licence price, a database is included automatically. By selection of the Oracle or Microsoft platform, its usage free of charge is limited by the particular producer to the data size and number of processors. Are these limitations exceeded, it is necessary to use the full-value version of the database machine; however, no changes occur on the K2 Business application side.

The technological openness of the K2 Business product enables, due to preparedness to the data input from the external environment, to make use of tools for wireless data transfer, data collection by means of bar code etc.
