

K2 HARDWARE

For Whom It Is Intended

The K2 Hardware product is intended not only for the users of the K2 Information System. Generally, it is suitable for all firms which want to secure maximum output, high reliability or optimal service for any part of the IT infrastructure. In

particular, it is suitable in the case when it is necessary to eliminate cost incurred due to demanding coordination of individual suppliers in the servicing process.

Aim

The aim is to maximize use value of the technological platform on which the K2 IS, incl. other information services, is operated. The benefit thereof is effective introduction of innovative technologies, both software and hardware ones. Thanks to certified professionals disposing not only of expert knowledge in the area of system software and hardware but also of no less important knowledge of links between the system resources and the K2 Information System services, the client can choose a solution which fulfils fully his/her requirements for implementation quality and K2 IS operation reliability.

Benefits

- > optimizing selection of appropriate technological means
- > easier implementation of the information system
- > quicker putting into sharp operation

- > guaranteed proper functionality of the information system as a whole
- > possible optimization as concerns meeting client's service needs
- > access to the knowledge base of an expert team
- > one partner for announcing requirements for service intervention
- > possible selection of the optimal extent with regard to the service care
- > possible selection of the optimal extent with regard to the service response
- > opportunity for regular preventive visits

Advantages

By appropriate application of the wide know-how of our specialists, the client gets a possibility to make always use of high-tech and, with regard to utilization, optimal IT facilities. An important part of the provided benefit is also a knowledge base being continuously extended, education level as well as number of specialists in the technical team. The result thereof is, therefore, stable and reliable operation of the information technologies, high level of flexibility and substitutability in the case of service interventions; thus, improved efficiency concerning operation of the whole firm.

Product is suitable for all firms which want to secure maximum output, high reliability or optimal service for any part of the IT infrastructure.

K2 Hardware means a way how to achieve optimal combination of the hardware and software equipment, expert implementation services and guaranteed service.

Thanks to strong position of the K2 atmitec mark in the market, it is possible to offer extraordinarily attractive price-output ratio with regard to the acquired technologies which would be not possible to achieve under standard conditions.

The result of the implementation process is an optimally set-up system with subsequent guarantee as concerns utility of the solution as a whole.

Description

K2 Hardware means a way how to achieve optimal combination of the hardware and software equipment, expert implementation services and guaranteed service. After thorough analysis, proposals are submitted to the client which are not only fully compliant with his/her business plans but which represent also optimal combination with regard to the total cost of ownership, future extendability, administration, and quality service. However, the implementator remains fully responsible for operation and stability of used technologies within the contractually defined extent.

Proposal for Modern System Architecture

A way to the target begins with proposal concerning architecture of the future system. A team of highly skilled system engineers permanently monitors and evaluates trends in the area of information technologies. Their knowledge is used when assessment as concerns possible solutions for client's needs is performed and proposals for various scenarios are prepared. Subsequently, particular possibilities are assessed with regard to the provided output, scalability, security, and stability level and, last but not least, to the total cost of ownership.

Optimal Coordination of Delivery

In order to implement the project for the clients, high-tech technologies of renowned producers are used. Thanks to strong position of the K2 atmitec mark in the market, it is possible to offer extraordinarily attractive price-output ratio with regard to the acquired technologies which would be not possible to achieve under standard conditions. Simultaneously with the technologies delivery, the coordination of particular activities is performed. All is managed by means of a project. First of all, the "bottlenecks" are identified and precise time planes are determined with guaranteed date for putting into operation.

Quality Implementation

Implementation is ensured by expert teams under leadership of system specialists. Thereby, knowledge of technologies being put into operation is ensured including links between individual subsystems and their impact on resulting utility of the K2 Information system.

The result of the implementation process is an optimally set-up system with subsequent guarantee as concerns utility of the solution as a whole.

Professional Care During The Whole Lifetime

A precondition for the maximum utilisation of the technologies with regard to the achievable output as well as with regard to the time during which the equipment is under operation is provision of regular professional care. Within the service relationship, it is possible for the client to identify the required extent of regular preventive visits of a specialist who ensures optimal operation of the IT technologies in order to minimize the service by cost connected with the operation of the system as a whole.
